

Level Count Display

Electronic Count & Display System to Easily Identify Location of Available Parking

The Secom Level Count Display System increments and decrements cars entering and leaving each level on the garage and displays real-time parking space availability at the entrance to the garage and even at each level as a reminder to the parking patron of current availability.

This versatile level count system can be integrated into any existing Secom system or can be used in a stand alone fashion. The small but powerful Secontroller 15 combined with Monitor Control Terminals (MCT's) and a series of vehicle detection loops combine to give your parking patrons the high level of service and information they need to quickly find available parking spaces.

System can be programmed to display the actual number of spaces available, a rounded down number for ease of recognition and identification, or for the very busy high volume garage a number that reflects the hysteresis in the true number of vehicles in transit on the level that are either approaching and vacating possible parking spaces.

*Available in post-mounted, wall mounted,
or anchored as shown;*

Rugged stainless steel cabinet;

*Black powder-coated or your choice of
custom color;*

Bright red long lasting LED lighting;

Bold 6" height numbers & letters;

Available in 4 - 12 level configurations;

Miniature office version available;

Individual level reminders;
